Execution of ls, cat and mkdir Commands in Kali Linux

1. Aim

To execute and study the ls, cat, and mkdir commands in the Kali Linux operating system and observe their outputs.

2. Requirements

Kali Linux operating system and its Terminal application.

3. Algorithm

1. Start Kali Linux and open the Terminal.
2. Move to a suitable practice directory using the cd command.
3. Type ls and press Enter to list the files and directories in the current directory.
4. Type cat sample.txt and press Enter to display the contents of the sample text file.
5. Type mkdir practice and press Enter to create a new directory named practice.
6. Use ls again to verify that the new directory has been created.
7. Observe and record the output of each command.
8. Stop the experiment.

4. Commands and Explanation

`ls`

Lists files and directories in the current directory.

`cat sample.txt`

Displays the contents of the file named sample.txt. Ensure that the file exists before running the command.

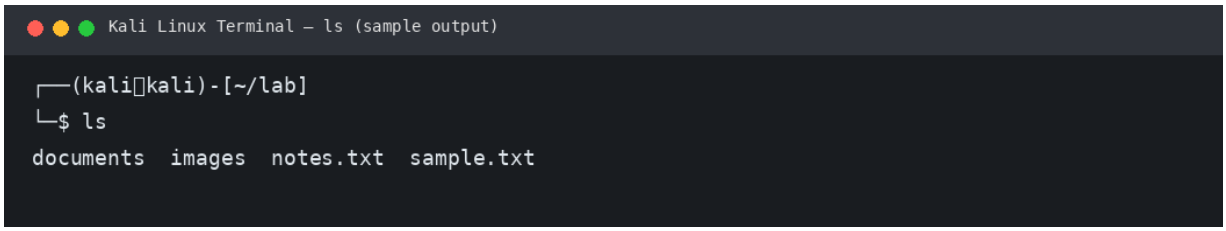

`mkdir practice`

Creates a new directory named practice. Use a different name if a directory with that name already exists.

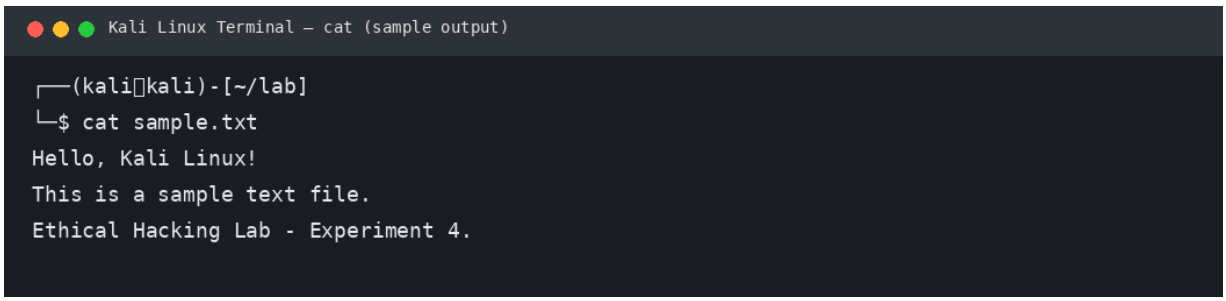

5. Output Screenshots

The following are illustrative terminal-style sample outputs showing the expected format. Replace them with screenshots captured from your own Kali Linux terminal if your lab requires actual execution evidence.

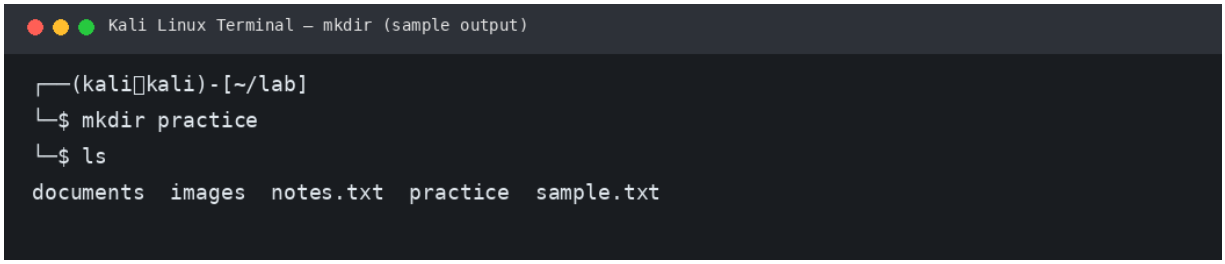

A. ls command

B. cat command

C. mkdir command

6. Result

Thus, the ls, cat, and mkdir commands were studied successfully. The ls command lists directory contents, the cat command displays file contents, and the mkdir command creates a new directory.
